Validate the forecast against the actuals.

2025 HISTORICAL DATA

Reference data for forecast validation. Apply a model, compare its output with actual transactions, and show the error metrics beside the result.

AVAILABLE SLICE **January - March 2025**

17,020 source transaction rows

01 / SOURCE

Data package

Line-level CSV, monthly summary, and manifest are separated from the canonical source data. The source history ends on 31 March 2025.

02 / COMPARE

Forecast validation

Use January and February history to forecast March, then compare the predictions with the held-out March actuals.

03 / EXPLAIN

Model evidence

Review MAPE, RMSE, WAPE, chronological validation, and the model comparison view before presenting a result.

From source history to a planning decision

The dashboard keeps the source data, model work, validation evidence, and planning controls connected.

Mitsubishi source
Customer, Item, and Sales Order History workbooks

→

2025 package
17,020 line-level rows plus monthly validation summary

→

MySQL + adapter
Canonical SQL history, filters, calendar views, and imports

→

Forecast engines
Trend, SARIMA, Random Forest, LSTM, XGBoost, and Ensemble

→

Dashboard
Forecast, models, classifier, inventory, and coverage views

What is measured

FORECAST ERROR

MAPE, RMSE, and WAPE are computed on chronological held-out windows.

MODEL COMPARISON

The Ensemble weights available members using validation evidence; unavailable members remain visible.

PLANNING CONTROLS

Horizon, dimension, granularity, and scenario edits change the planning view, not the historical score.

The source snapshot ends on 31 March 2025. Daily and weekly displays are allocated planning estimates from the monthly source contract.

Five views for the pitch

A simple pitch path from source data to a planning decision.

01 **Forecast workspace**
Choose model, metric, dimension, filters, calendar, and horizon. Inspect history, point forecast, ranges, and editable planning preview.

02 **Model performance**
Compare validation scores, WAPE, accuracy, MASE, folds, Ensemble weights, and member availability.

03 **Demand classifier**
Review Neural Network Rev 9 high-demand probabilities and Tabular Transformer Rev 8 sold/not-sold probabilities.

04 **Lead-time inventory**
Translate demand history into lead-time demand, safety stock, reorder point, order-by date, and expected arrival.

05 **Data & coverage**
Show source coverage, dimensions, assumptions, native history, and the limits of the current data snapshot.

PITCH DEMO

Start with the 2025 summary, select a model, forecast March from January-February history, compare with March actuals, and finish on Model performance to explain the metric and the data period.
